Lab Task: Installation of Xampp (Apache, MariaDB, Php and Pearl) – A software that makes computer local server and enables it to run PHP

1. First of all, we need to download zip file from the official website of **Xampp**. In my case, **Macintosh**, I have downloaded **.dmg** file.
2. Having it downloaded and installed, the next step is to open it and start the server namely **Apache** and **SQL**

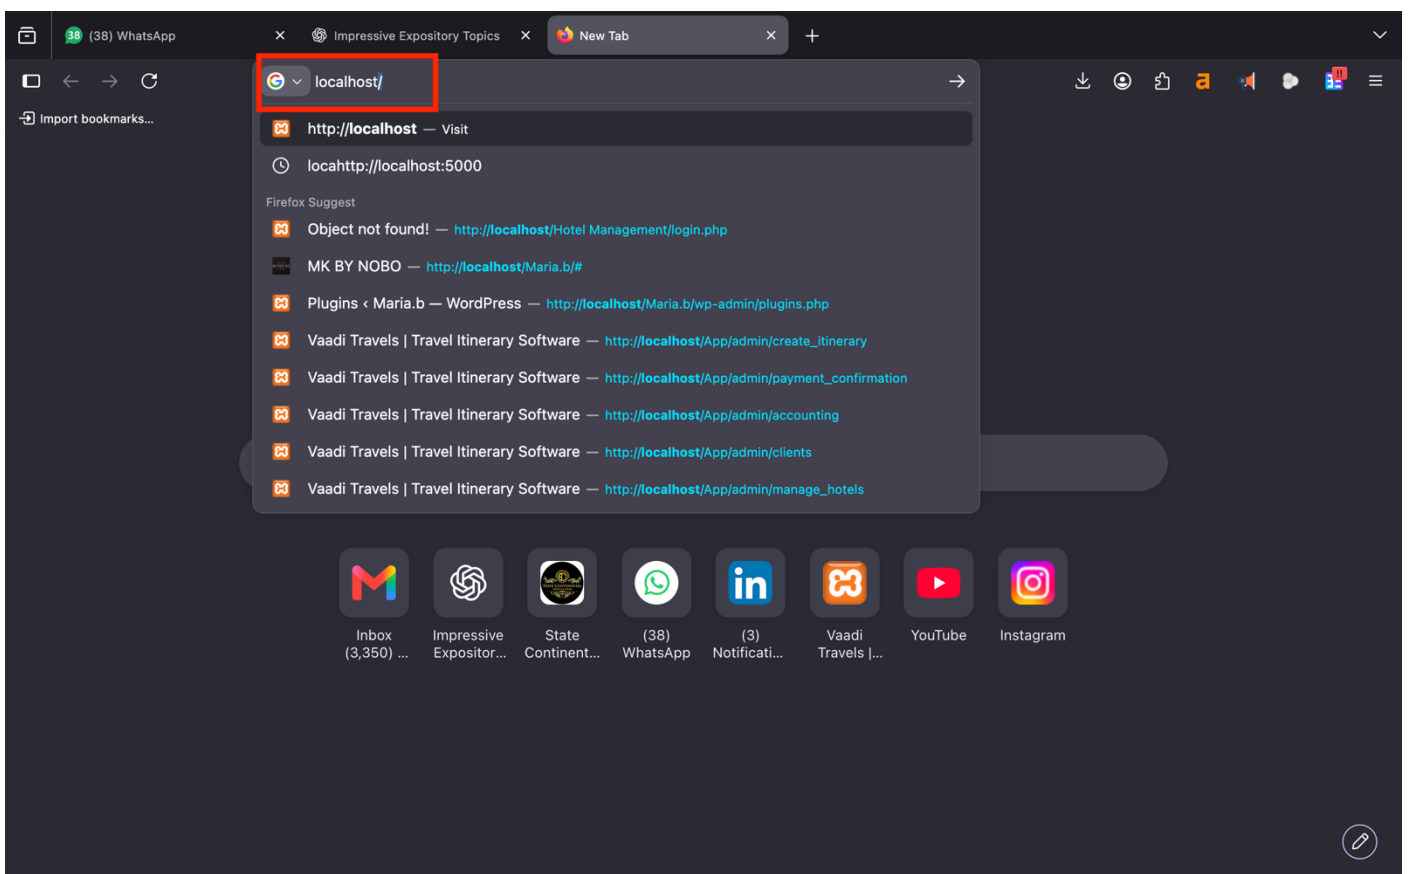

The screenshots for these tasks are in the following:

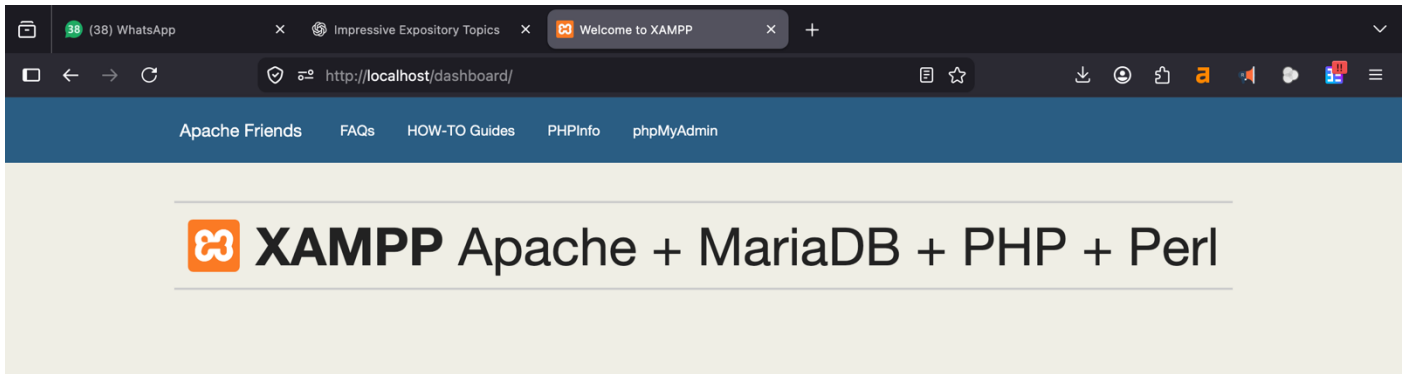

The xampp is installed and the Sql and Apache servers are now running. So, let run localhost on our browser. To do so, we have to write “localhost” in the searchbar.

Welcome to XAMPP for OS X 8.2.4

You have successfully installed XAMPP on this system! Now you can start using Apache, MariaDB, PHP and other components. You can find more info in the [FAQs](#) section or check the [HOW-TO Guides](#) for getting started with PHP applications.

XAMPP is meant only for development purposes. It has certain configuration settings that make it easy to develop locally but that are insecure if you want to have your installation accessible to others.

Start the XAMPP Control Panel to check the server status.

Community

XAMPP has been around for more than 10 years – there is a huge community behind it. You can get involved by joining our [Forums](#), liking us on [Facebook](#), or following our exploits on [Twitter](#).
